List of Attachments (including a total number of pages in each attachment):

Attachment NO.1: GRL-USB-PD Compliance Test Solution, 118 pages.

Attachment NO.2: GRL-USB-PD Compliance Test Solution, 9 pages.

Attachment NO.3: Photo documentation, 2 pages.

Summary of testing:

All applicable test completed and meet requirements.

Tests performed (name of test and test clause):

See report

Testing location:

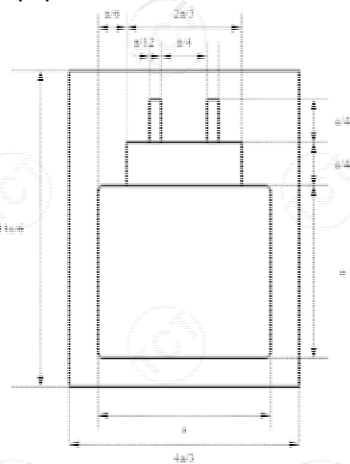

See above for details.

Copy of marking plate:

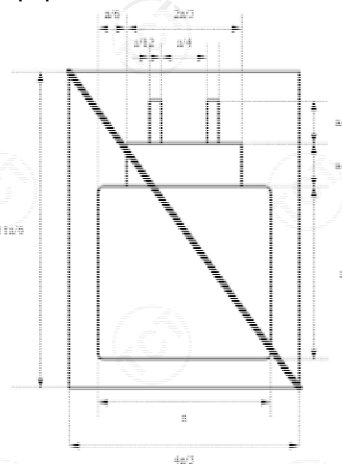

The artwork below may be only a draft. The use of certification marks on a product must be authorized by the respective NCBs that own these marks.

Marking and labelling information on package and user manual: 1a or 1b, and 2. (Requirements according to 2022/2380/EU if applicable, see corresponding legislation for details.)

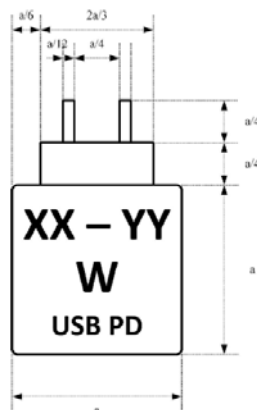

1a) A charging device is included with the radio equipment:

1b) No charging device is included with the radio equipment:

2) Content and format of the label:

Note:

1: The dimension "a" shall be greater than or equal to 7 mm;

2: "XX" the minimum power required by the radio equipment to charge;

"YY" the maximum power required by the radio equipment to achieve maximum charging speed;

"USB PD" (USB Power Delivery) : if the radio equipment supports that charging communication protocol;

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict

4	Functional		P
	This chapter covers the functional requirements for the signaling across the USB Type-C® cables and connectors. This includes functional signal definition, discovery and configuration processes, and power delivery.		N/A
4.1	Signal Summary		N/A
4.2	Signal Pin Descriptions		N/A
4.2.1	SuperSpeed USB Pins		N/A
4.2.2	USB 2.0 Pins		N/A
4.2.3	Auxiliary Signal Pins		N/A
4.2.4	Power and Ground Pins		N/A
4.2.5	Configuration Pins		N/A
4.3	Sideband Use (SBU)		P
	The Sideband Use pins (SBU1 and SBU2) are limited to the uses as defined by this specification and additional functionality defined in the USB4 Specification. See Appendix E and Appendix A for use of the SBU pins in Alternate Modes and Audio Adapter Accessory Mode.		N/A
	The SBU pins on a port shall either be open circuit or have a weak pull-down to ground no stronger than zSBU Termination when in USB 3.2 or USB 2.0.		P
	These pins are pre-wired in the standard USB Full-Featured Type-C cable as individual single-ended wires (SBU_A and SBU_B). Note that SBU1 and SBU2 are cross-connected in the cable.		N/A
	When operating in USB4, these pins are used as the USB4 Sideband Channel with SBU1 mapping to SBTX and SBU2 mapping to SBRX. SBTX and SBRX functional requirements are as defined in the USB4 Specification. When a port determines that the locally-inserted plug is flipped (i.e. CC1 is open, CC2 is terminated), the USB4 Specification (reference Sideband Channel Lane Reversal) dictates that the port flip the SBTX and SBRX mappings to SBU1 and SBU2 in order to assure proper sideband transmit-to-receive end-to-end operation.		N/A
4.4	Power and Ground		P
4.4.1	IR Drop		N/A
	The maximum allowable cable IR drop for ground (including ground on a captive cable) shall be 250 mV and for VBUS shall be 500 mV through the cable to the cable's maximum rated VBUS current capacity. When VCONN is being		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	sourced, the IR drop for the ground shall still be met considering any additional VCONN return current.		
4.4.2	VBUS		P
	The allowable default range for VBUS as measured at the Source receptacle shall be as defined by the USB 2.0 Specification and USB 3.2 Specification. For USB4, the USB 3.2 Specification is used for this requirement. NOTE that due to higher currents allowed, legacy devices may experience a higher voltage (up to 5.5V maximum) at light loads.		N/A
	The Source's USB Type-C receptacle VBUS pin shall remain unpowered and shall limit the capacitance between VBUS and GND as specified in Table 4-2 until a Sink is attached. The VBUS pin shall return to the unpowered state when the Sink is detached. See Table 4-29 for VBUS timing values. Legacy hosts/chargers that by default source VBUS when connected using any legacy USB connector (Standard-A, Micro-B, etc.) to USB Type-C cable or adapter are exempted from these two requirements.		P
	A DRP or Source (or device with Accessory Support) implementing an Rp pull-up as its method of connection detection shall provide an impedance between VBUS and GND on its receptacle pins as specified in Table 4-2 when not sourcing power on VBUS (i.e., when in states Unattached. SRC or Unattached. Accessory).		P
4.4.3	VCONN		N/A
	VCONN is provided by the Source to power cables with electronics in the plug. VCONN is provided over the CC pin that is determined not to be connected to the CC wire of the cable.		N/A
	Initially, VCONN shall be sourced on all Source USB Type-C receptacles that utilize the TX and RX pins during specific connection states as described in Section 4.5.2.2. Subsequently, if VCONN is not explicitly required by the cable or device as indicated in its eMarker, VCONN may be removed as described in Table 4-4. VCONN may also be sourced by USB Type-C receptacles that do not utilize the TX and RX pins as described in Section 4.5.2.2. USB PD VCONN_Swap command also provides the Source a means to request that the attached Sink source VCONN.		N/A
	To aid in reducing the power associated with supplying VCONN, a Source is allowed to either not source VCONN or turn off VCONN under any of the following conditions:		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	Ra is not detected on the CC pin after tCCDebounce when the other CC pin is in the SRC.Rd state, or		N/A
	if there is no GoodCRC response to USB PD Discover Identity messages sent to SOP'.		N/A
	If the power source used to supply VCONN power is a shared power source for other USB VCONN and VBUS outputs, it must be bypassed with capacitance identical to the VBUS capacitance requirements of USB 3.2 Section 11.4.4 – Dynamic Attach and Detach. Any VCONN power source bypass capacitance must be isolated from the CC pins when VCONN is not being provided.		N/A
	The cable shall remove or weaken Ra according to the state diagram behavior in 4.5.2.5. The cable shall reapply Ra according to the state diagram behavior in 4.5.2.5. The cable shall discharge VCONN to below vVCONNDischarge on a cable disconnect. The cable shall control Ra at each of its ends independently based on the VCONN on that end.		N/A
	Implementation Note: Increasing Ra to 20KΩ will meet both the power dissipation for electronically marked passive cables and discharge 10μF to less than vVCONNDischarge in tvVCONNDischarge.		N/A
	The VPA shall remove or weaken Ra within tRaWeaken (as defined in Table 4-7) after VCONN enters the valid voltage range (vVCONNValid).		N/A
	The VPA shall reapply Ra when VCONN falls below vRaReconnect as defined in Table 4-7. The VPA shall discharge VCONN to below vVCONNDischarge within tvVCONNDischarge on a cable disconnect. The VPA shall consider the VCONN capacitance present in the accessory when discharging VCONN.		N/A
	The maximum power consumption while in an Alternate Mode is defined by the specification specific to the Alternate Mode being used.		N/A
	The VPD shall remove or weaken Ra within tRaWeaken (as defined in Table 4-8) after VCONN enters the valid voltage range (vVCONNValid).		N/A
	The VPD shall reapply Ra when VCONN falls below vRaReconnect as defined in Table 4-8. The VPD shall discharge VCONN to below vVCONNDischarge within tvVCONNDischarge on a cable disconnect. The VPD shall consider the VCONN capacitance present in the device when discharging VCONN.		N/A
4.5	Configuration Channel (CC)		P
4.5.1	Architectural Overview		P

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	For the USB Type-C solution, two pins on the connector, CC1 and CC2, are used to establish and manage the Source-to-Sink connection. When the device is connected through a hub, the connection between a Sink (UFP) on the hub and the Source (host port) and the connection between the Sink (device port) and a Source (DFP on the hub), are treated as separate connections. Functionally, the configuration channel is used to serve the following purposes.		N/A
	Detect attach of USB ports, e.g. a Source to a Sink		N/A
	Resolve cable orientation and twist connections to establish USB data bus routing		N/A
	Establish data roles between two attached ports		N/A
	Discover and configure VBUS: USB Type-C Current modes or USB Power Delivery		N/A
	Configure VCONN		N/A
	Discover and configure optional Alternate and Accessory modes		N/A
4.5.1.1	USB Data Bus Interface and USB Type-C Plug Flip-ability		N/A
	Since the USB Type-C plug can be inserted in either right-side-up or upside-down position, the hosts and devices that support USB data bus functionality must operate on the signal pins that are actually connected end-to-end. In the case of USB 2.0, this is done by shorting together the two D+ signal pins and the two D- signal pins in the host and device receptacles. In the case of USB 3.2 SuperSpeed USB or USB4 TX/RX signals in a single-lane implementation, it requires the functional equivalent of a switch in both the host and device to appropriately route the TX and RX signal pairs to the connected path through the cable. For a USB 3.2 SuperSpeed USB or USB4 dual-lane implementation, the host and/or device resolves the lane ordering.		N/A
	To establish the proper routing of the active USB data bus from host to device, the standard USB Type-C cable is wired such that a single CC wire is position aligned with the first TX/RX signal pairs (TXp1/TXn1 and RXp1/RXn1) – in this way, the CC wire and TX/RX data bus wires that are used for single-lane operational signaling within the cable track with regard to the orientation and twist of the cable. By being able to detect which of the CC pins (CC1 or CC2) at the receptacle is terminated by the device, the host is able to determine which		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	TX/RX signals are to be used for the single-lane connection and the host can use this to control the functional switch for routing the TX/RX signal pairs. Similarly in the device, detecting which of the CC pins at the receptacle is terminated by the host allows the device to control the functional switch that routes its TX/RX signal pairs.		
	For a dual-lane implementation, the TX/RX signal pairs in the cable/plug aligned with the CC wire/pin is Lane 0 and in reference to USB 3.2, shall be identified as the Configuration Lane. The second TX/RX signal pairs (TXp2/TXn2 and RXp2/RXn2) in the cable/plug is Lane 1 of a dual-lane configuration.		N/A
	The functional requirements for implementing TX/RX data bus routing for the USB Type-C receptacle are not included in the scope of this specification. There are multiple host, device and hub architectures that can be used to accomplish this which could include either discrete or integrated switching, and could include merging this functionality with other USB 3.2 or USB4 design elements, e.g. a bus repeater.		N/A
	The functional requirements for addressing SBU1 and SBU2 routing is not included in the scope of this specification. For USB4, where SBTX and SBRX are mapped to SBU1 and SBU2, the adjustment to the mapping of these signals based on the connection state (flipped and/or twisted) of the cable is defined by the USB4 Specification (reference Sideband Channel Lane Reversal).		N/A
4.5.1.2	Connecting Sources and Sinks		P
	Given that the USB Type-C receptacle and plug no longer differentiate host and device roles based on connector shape, e.g., as was the case with USB Type-A and Type-B connectors, any two ports that have USB Type-C receptacles can be connected together with a standard USB Type-C cable. Table 4-9 summarizes the expected results when interconnecting Source, Sink and DRP ports.		N/A
	In the cases where no function results, neither port shall be harmed by this connection. The user has to independently realize the invalid combination and take appropriate action to resolve. While these two invalid combinations mimic traditional USB where host-to-host and device-to-device connections are not intended to work, the non-keyed USB Type-C solution does not prevent the user from attempting such interconnects. VBUS and VCONN shall not be applied by a Source (host) in these cases.		P

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	The typical flow for the configuration of the interface in the general USB case of a Source (Host) to a Sink (Device) is as follows:		N/A
	1. Detect a valid connection between the ports (including determining cable orientation, Source/Sink and DFP/UFP relationship)		N/A
	2. Optionally discover the cable's capabilities		N/A
	3. Optionally establish alternatives to traditional USB power (See Section 4.6.2)		N/A
	a. USB PD communication over CC for advanced power delivery negotiation		N/A
	b. USB Type-C Current modes		N/A
	c. USB BC 1.2		N/A
	4. USB Device Enumeration		N/A
	For cases of Dual-Role-Power (DRP) ports connecting to either Source-only, Sink-only or another DRP, the process is essentially the same except that during the detecting a valid connection step, the DRP alternates between operating as a Source for detecting an attached Sink and presenting as a Sink to be detected by an attached Source. Ultimately this results in a Source-to-Sink connection.		N/A
4.5.1.2.1	Detecting a Valid Source-to-Sink Connection		N/A
	The general concept for setting up a valid connection between a Source and Sink is based on being able to detect terminations residing in the product being attached.		N/A
	To aid in defining the functional behavior of CC, a pull-up (Rp) and pull-down (Rd) termination model is used – actual implementation in hosts and devices may vary, for example, the pullup termination could be replaced by a current source. Figure 4-5 and Figure 4-6 illustrates two models, the first based on a pull-up resistor in the Source and the second replacing this with a current source.		N/A
	Initially, a Source exposes independent Rp terminations on its CC1 and CC2 pins, and a Sink exposes independent Rd terminations on its CC1 and CC2 pins, the Source-to-Sink combination of this circuit configuration represents a valid connection. To detect this, the Source monitors CC1 and CC2 for a voltage lower than its unterminated voltage – the choice of Rp is a function of the pull-up termination voltage and the Source's detection circuit. This indicates that either a Sink, a powered cable, or a Sink connected via a powered cable has been attached.		N/A
	Prior to application of VCONN, a powered cable exposes Ra on its VCONN pin. Ra		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	represents the load on VCONN plus any resistive elements to ground. In some cable plugs it might be a pure resistance and in others it may be simply the load.		
	The Source has to be able to differentiate between the presence of Rd and Ra to know whether there is a Sink attached and where to apply VCONN. The Source is not required to source VCONN unless Ra is detected.		N/A
	Two special termination combinations on the CC pins as seen by a Source are defined for directly attached Accessory Modes: Ra/Ra for Audio Adapter Accessory Mode (Appendix A) and Rd/Rd for Debug Accessory Mode (Appendix B).		N/A
	The Source uses de-bounce timers to reliably detect states on the CC pins to de-bounce the connection (tCCDebounce), and hide USB PD BMC communications (tPDDebounce).		N/A
	Once the Sink is powered, the Sink monitors CC1 and CC2 for a voltage greater than its local ground. The CC pin that is at a higher voltage (i.e. pulled up by Rp in the Source) indicates the orientation of the plug.		N/A
	Figure 4-3 shows how the inserted plug orientation is detected at the Source's receptacle by noting on which of the two CC pins in the receptacle an Rd termination is sensed. Now that the Source (Host) has recognized that a Sink (Device) is attached and the plug orientation is determined, it configures the TX/RX data bus routing to the receptacle.		N/A
	The Source (Host) then turns on VBUS. For the CC pin that does not connect Source-to-Sink through the cable, the Source supplies VCONN and may remove the termination. With the Sink (Device) now powered, it configures the USB data path. This completes the Host-to-Device connection.		N/A
	The Source monitors the CC wire for the loss of pull-down termination to detect detach. If the Sink is removed, the Source port removes any voltage applied to VBUS and VCONN, resets its interface configuration and resumes looking for a new Sink attach.		N/A
	Once a valid Source-to-Sink connection is established, alternatives to traditional USB power (VBUS as defined by either USB 2.0 or USB 3.2 specifications) may be available depending on the capabilities of the host and device. These include USB Type-C Current, USB Power Delivery, and USB Battery Charging 1.2.		N/A
	In the case where USB PD PR_Swap is used to swap the Source and Sink of VBUS, the supplier of VCONN remains unchanged during		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	and after the VBUS power swap. The new Source monitors the CC wire and the new Sink monitors VBUS to detect detach. When a detach event is detected, any voltages applied to VBUS and VCONN are removed, each port resets its interface configuration and resumes looking for an attach event.		
	In the case where USB PD DR_Swap is used to swap the data roles (DFP and UFP), the source of VBUS and VCONN do not change after the data role swap.		N/A
	In the case where USB PD VCONN Swap is used to swap the VCONN source, the VBUS Source/Sink and DFP/UFP roles are maintained during and after the VCONN swap.		N/A
	The last step in the normal USB Type-C connect process is for the USB device to be attached and enumerated per standard USB 2.0 and USB 3.2 processes.		N/A
4.5.1.3	Configuration Channel Functional Models		N/A
	The functional models for the configuration channel behavior based on the CC1 and CC2 pins are described in this section for each port type: Source, Sink and Dual-Role-Power (DRP).		N/A
	The figures in the following sections illustrate the CC1 and CC2 routing after the CC detection process is complete. In these figures, VBUS and VCONN may or may not actually be available.		N/A
4.5.1.3.1	Source Configuration Channel Functional Model		N/A
	Referring to Figure 4-7, a port that behaves as a Source has the following functional characteristics:		N/A
	1. The Source uses a FET to enable/disable power delivery across VBUS and initially the Source has VBUS disabled.		N/A
	2. The Source supplies pull-up resistors (Rp) on CC1 and CC2 and monitors both to detect a Sink. The presence of an Rd pull-down resistor on either pin indicates that a Sink is being attached. The value of Rp indicates the initial USB Type-C Current level supported by the host.		N/A
	3. The Source can optionally clamp the voltage on either of its CC pins. The minimum clamping voltage shall be vCC-Clamp. The clamp is intended to protect the Source circuitry associated with CC functionality.		N/A
	4. The Source uses the CC pin pull-down characteristic to detect and establish the correct routing for the SuperSpeed USB data path and determine which CC pin is intended for supplying VCONN.		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	5. Once a Sink is detected, the Source enables VBUS and VCONN.		N/A
	6. The Source can dynamically adjust the value of R_p to indicate a change in available USB Type-C Current to a Sink.		N/A
	7. The Source monitors the continued presence of R_d to detect Sink detach. When a detach event is detected, the Source removes, if supplied, VBUS and VCONN, and returns to step 2.		N/A
	8. If the Source supports advanced functions (USB Power Delivery and/or Alternate Modes), USB PD communication is required.		N/A
4.5.1.3.2	Sink Configuration Channel Functional Model		N/A
	Referring to Figure 4-9, a port that behaves as a Sink has the following functional characteristics:		N/A
	1. The Sink terminates both CC1 and CC2 to GND using pull-down resistors.		N/A
	2. The Sink determines that a Source is attached by the presence of power on VBUS.		N/A
	3. The Sink uses the CC pin pull-up characteristic to detect and establish the correct routing for the SuperSpeed USB data path.		N/A
	4. The Sink can optionally monitor CC to detect an available higher USB Type-C Current from the Source. The Sink shall manage its load to stay within the detected Source current limit.		N/A
	5. The Sink can optionally clamp the voltage on either of its CC pins. The minimum clamping voltage shall be $v_{CC-Clamp}$. The clamp is intended to protect the Sink circuitry associated with CC functionality.		N/A
	6. If the Sink supports advanced functions (USB Power Delivery and/or Alternate Modes), USB PD communication is required.		N/A
4.5.1.3.3	Dual-Role-Power (DRP) Configuration Channel Functional Model		N/A
	Referring to Figure 4-11, a port that can alternate between DFP and UFP behaviors has the following functional characteristics:		N/A
	1. The DRP uses a FET to enable/disable power delivery across VBUS and initially when in Source mode has VBUS disabled.		N/A
	2. The DRP uses switches for presenting as a Source or Sink.		N/A
	3. The DRP has logic used during initial attach to toggle between Source and Sink operation:		N/A
	a. Until a specific stable state is established, the DRP alternates between exposing itself as a Source and Sink. The timing of this process is		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	dictated by a period (tDRP), percentage of time that a DRP exposes Rp (dcSRC. DRP) and role transition time (tDRPTransition).		
	b. When the DRP is presenting as a Source, it follows Source operation to detect an attached Sink – if a Sink is detected, it applies VBUS, VCONN, and continues to operate as a Source (e.g., cease alternating).		N/A
	c. When the DRP is presenting as a Sink, it monitors VBUS to detect that it is attached to a Source – if a Source is detected, it continues to operate as a Sink (cease alternating).		N/A
	4. If the DRP supports advanced functions (USB Power Delivery and/or Alternate Modes), USB PD communication is required.		N/A
4.5.1.4	USB Type-C Port Power Roles and Role Swapping Mechanisms		N/A
	USB Type-C ports on products (USB hosts, USB devices, USB chargers, etc.) can be generally characterized as implementing one of seven power role behavioral models:		N/A
	Source-only		N/A
	Source (Default) – strong preference toward being a Source but subsequently capable of becoming a Sink using USB PD swap mechanisms.		N/A
	Sink-only		N/A
	Sink (Default) – strong preference toward being a Sink but subsequently capable of becoming a Source using USB PD swap mechanisms.		N/A
	DRP: Toggling (Source/Sink)		N/A
	DRP: Sourcing Device		N/A
	DRP: Sinking Host		N/A
	Two independent sets of swapping mechanisms are defined for USB Type-C port implementations, one based on role swapping within the initial state machine connection process and the other based on subsequent use of USB PD-based swapping mechanisms.		N/A
4.5.1.4.1	USB Type-C State-Machine-Based Role Swapping		N/A
	During the initial USB Type-C state machine connection process, the products being connected end up in one of the two following roles associated with the termination of its port:		N/A
	Rp - VBUS and VCONN source and behaving as a downstream facing port (USB Host)		N/A
	Rd - VBUS sink and behaving as an upstream facing port (USB Device)		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	A USB Type-C DRP-based product may incorporate either or both the Try.SRC and Try.SNK swap mechanisms to affect the resulting role. Try.SRC allows a DRP that has a policy-based preference to be a Source when connecting to another DRP to affect a transition from a destined Sink role to the Source role. Alternately, Try.SNK allows a DRP that has a policybased preference to be a Sink when connecting to another DRP to effect a transition from a destined Source role to the Sink role. Connection timing and other factors are involved in this process as defined in the USB Type-C state machine operation (see Section 4.5.2). It is important to note that these mechanisms, Try.SRC and Try.SNK, can only be used once as part of the initial connection process.		N/A
	Try.SRC and Try.SNK are intended to ensure more predictable power roles when initially connecting two DRPs, especially if the port partner does not support USB PD. For example, a small mobile device may want to implement Try.SNK, so that when attaching to a DRP laptop, the mobile device will always initially be the power sink. Similarly, a laptop or Power Bank may wish to implement Try.SRC to ensure it always sources power to attached DRPs. Selfpowered devices such as AMAs or those whose primary function is a data UFP may also consider implementing Try.SNK to ensure they can properly expose their functionality. If both sides support USB PD, the appropriate roles may then be further refined or swapped as per the USB PD specification.		N/A
4.5.1.4.2	USB PD-based Power Role, Data Role and VCONN Swapping		N/A
	Following the completion of the initial USB Type-C state machine connection process, products may use USB PD-based swapping mechanisms to command a change power roles, data roles and which end of the cable will supply VCONN. These mechanisms are:		N/A
	USB PD PR Swap : swaps Source (Rp) and Sink (Rd)		N/A
	USB PD DR Swap : swaps DFP (host data) and UFP (device data) roles		N/A
	USB PD VCONN Swap : swaps which port supplies VCONN		N/A
4.5.1.4.3	Power Role Behavioral Model Summary		N/A
4.5.2	CC Functional and Behavioral Requirements		P

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	This section provides the functional and behavioral requirements for implementing CC. The first sub-section provides connection state diagrams that are the basis for the remaining subsections.		N/A
	The terms Source (SRC) and Sink (SNK) used in this section refer to the port's power role while the terms DFP and UFP refer to the port's data role. A DRP (Dual-Role-Power) port is capable of acting as either a Source or Sink. Typically, Sources are found on hosts and supply VBUS while a Sink is found on a device and consumes power from VBUS. When a connection is initially made, the port's initial power state and data role are established. USB PD introduces three swap commands that may alter a port's power or data role:		N/A
	The PR_Swap command changes the port's power state as reflected in the following state machines. PR_Swap does not change the port sourcing VCONN.		N/A
	The DR_Swap command has no effect on the following state machines or VCONN as it only changes the port's data role.		N/A
	VCONN_Swap command changes the port sourcing VCONN. The PR_Swap command and DR_Swap command have no effect on the port sourcing VCONN.		N/A
	The connection state diagrams and CC behavior descriptions in this section describe the behavior of receptacle-based ports. The plug on a direct connect device or a device with a captive cable shall behave as a plug on a cable that is attached at its other end in normal orientation to a receptacle. These devices shall apply and sense CC voltage levels on pin A5 only and pin B5 shall have an impedance above zOPEN, unless it is a VCONN-Powered Accessory, in which case B5 shall have an impedance Ra.		N/A
4.5.2.1	Connection State Diagrams		N/A
	This section provides reference connection state diagrams for CC-based behaviors.		N/A
	Refer to Section 4.5.2.2 for the specific state transition requirements related to each state shown in the diagrams.		N/A
	Refer to Section 4.5.2.4 for a description of which states are mandatory for each port type, and a list of states where USB PD communication is permitted.		N/A
4.5.2.2	Connection State Machine Requirements		P
	Entry into any unattached state when "directed from any state" shall not be used to override tDRP toggle.		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	A DRP or a Sink may consume default power from VBUS in any state where it is not required to provide VBUS.		N/A
	The following two tables define the electrical states for a CC pin in both a Source and a Sink. Every port has CC1 and CC2 pins, each with its own individual CC pin state. The combination of a port's CC1 and CC2 pin states are be used to define the conditions under which a port transitions from one state to another.		N/A
4.5.2.2.1	Disabled State		P
	The Disabled state is where the port prevents connection from occurring by removing all terminations from the CC pins.		N/A
	The port should transition to the Disabled state from any other state when directed. When the port transitions to the Disabled state from Attached.SNK, it shall keep all terminations on the CC pins removed for a minimum of tErrorRecovery.		N/A
	A port may choose not to support the Disabled state. If the Disabled state is not supported, the port shall be directed to either the Unattached.SNK or Unattached.SRC states after power-on.		P
4.5.2.2.1.1	Disabled State Requirements		P
	The port shall not drive VBUS or VCONN, and shall present a high-impedance to ground (above zOPEN) on its CC1 and CC2 pins.		P
4.5.2.2.1.2	Exiting from Disabled State		N/A
	A Sink shall transition to Unattached.SNK when directed.		N/A
	A Source shall transition to Unattached.SRC when directed.		N/A
	A DRP shall transition to either Unattached.SNK or Unattached.SRC when directed.		N/A
4.5.2.2.2	ErrorRecovery Stat		N/A
	The ErrorRecovery state is where the port removes the terminations from the CC1 and CC2 pins for tErrorRecovery followed by transitioning to the appropriate Unattached.SNK or Unattached.SRC state based on port type. This is the equivalent of forcing a detach event and looking for a new attach.		N/A
	Ports that support USB Power Delivery shall support the ErrorRecovery state.		N/A
	Ports that support the ErrorRecovery state shall transition to the ErrorRecovery state from any other state when directed.		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	does not support USB Power Delivery may choose not to support the ErrorRecovery state. If the ErrorRecovery state is not supported, the port shall be directed to the Disabled state if supported. If the Disabled state is not supported, the port shall be directed to either the Unattached.SNK or Unattached.SRC states.		N/A
4.5.2.2.2.1	ErrorRecovery State Requirements		N/A
	The port shall not drive VBUS or VCONN, and shall present a high-impedance to ground (above zOPEN) on its CC1 and CC2 pins.		N/A
4.5.2.2.2.2	Exiting from ErrorRecovery State		N/A
	A Sink shall transition to Unattached.SNK after tErrorRecovery.		N/A
	A Source shall transition to Unattached.SRC after tErrorRecovery.		N/A
	A DRP (Figure 4-15) and a DRP with Accessory and Try.SNK Support (Figure 4-17) shall transition to Unattached.SNK after tErrorRecovery.		N/A
	A DRP with Accessory and Try.SRC Support (Figure 4-16) shall transition to Unattached.SRC after tErrorRecovery.		N/A
4.5.2.2.3	Unattached.SNK State		P
	When in the Unattached.SNK state, the port is waiting to detect the presence of a Source.		N/A
	A port with a dead battery shall enter this state while unpowered.		P
4.5.2.2.3.1	Unattached.SNK Requirements		N/A
	The port shall not drive VBUS or VCONN.		N/A
	Both CC1 and CC2 pins shall be independently terminated to ground through Rd.		N/A
	A Charge-Through VCONN-Powered USB Device shall isolate its Host-side port from its Charge-Through port, including CCs and VBUS, and independently terminate its Charge-Through port's CC1 and CC2 pins and Host-side port's CC pin to ground through Rd.		N/A
4.5.2.2.3.2	Exiting from Unattached.SNK State		P
	If the port supports USB PD or accessories, the port shall transition to AttachWait.SNK when the SNK.Rp state is present on at least one of its CC pins.		P
	The maximum times that a Port shall take to transition to AttachWait.SNK are the following:		N/A
	tNoToggleConnect when neither Port Partner is toggling		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	tOnePortToggleConnect when one Port Partner only is toggling		N/A
	When both Port Partners are toggling, a Port should transition to AttachWait.SNK within tTwoPortToggleConnect. Note that when both Port Partners are DRPs it is indeterminate whether the local port will transition to AttachWait.SRC or AttachWait.SNK.		N/A
	A USB 2.0 only Sink that doesn't support accessories and is self-powered or requires only default power and does not support USB PD may transition directly to Attached.SNK when VBUS is detected.		N/A
	A DRP shall transition to Unattached.SRC within tDRPTransition after the state of both CC pins is SNK.Open for tDRP – dcSRC.DRP · tDRP, or if directed.		P
	A Sink with Accessory support shall transition to Unattached.Accessory within tDRPTransition after the state of both the CC1 and CC2 pins is SNK.Open for tDRP – dcSRC.DRP · tDRP, or if directed.		N/A
	A Charge-Through VCONN-Powered USB Device shall transition to Unattached.SRC within tDRPTransition after the state of the Host-side port's CC pin is SNK.Open for tDRP – dcSRC.DRP · tDRP and both of the following is detected on the Charge-Through port.		N/A
	SNK.Rp state is detected on exactly one of the CC1 or CC2 pins for at least tCCDebounce		N/A
	VBUS is detected		N/A
	A Charge-Through VCONN-Powered USB Device shall transition to Attached.SNK when a Source connection is detected, as indicated by the SNK.Rp state on its Host-side port's CC pin.		N/A
4.5.2.2.4	AttachWait.SNK State		P
	When in the AttachWait.SNK state, the port has detected the SNK.Rp state on at least one of its CC pins and is waiting for VBUS.		N/A
	When in the AttachWait.SNK state, the Charge-Through VCONN-Powered USB Device has detected the SNK.Rp state on its Host-side port's CC pin and is waiting for host-side VBUS.		N/A
4.5.2.2.4.1	AttachWait.SNK Requirements		N/A
	The port shall not drive VBUS or VCONN.		N/A
	Both the CC1 and CC2 pins shall be independently terminated to ground through Rd.		N/A
	A Charge-Through VCONN-Powered USB Device shall isolate its Host-side port from its Charge-Through port, including CCs and		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	VBUS, and independently terminate its Charge-Through port's CC1 and CC2 pins and Host-side port's CC pin to ground through Rd.		
	It is strongly recommended that a USB 3.2 SuperSpeed device hold off VBUS detection to the device controller until the Attached.SNK state or the DebugAccessory.SNK state is reached, i.e. at least one CC pin is in the SNK.Rp state. Otherwise, it may connect as USB 2.0 when attached to a legacy host or hub's DFP.		N/A
4.5.2.2.4.2	Exiting from AttachWait. SNK State		P
	A Sink shall transition to Unattached.SNK when the state of both the CC1 and CC2 pins is SNK.Open for at least tPDDebounce.		N/A
	A DRP shall transition to Unattached.SRC when the state of both the CC1 and CC2 pins is SNK.Open for at least tPDDebounce.		P
	The port shall transition to Attached.SNK after the state of only one of the CC1 or CC2 pins is SNK.Rp for at least tCCDebounce and VBUS is detected. Note the Source may initiate USB PD communications which will cause brief periods of the SNK.Open state on one of the CC pins with the state of the other CC pin remaining SNK.Open, but this event will not exceed tPDDebounce.		N/A
	If the port is a VCONN-Powered Accessory or a VCONN-Powered USB Device, the port shall transition to Attached.SNK when either VCONN or VBUS is detected. The port may transition without waiting tCCDebounce on CC.		N/A
	If the port supports Debug Accessory Mode, the port shall transition to DebugAccessory.SNK if the state of both the CC1 and CC2 pins is SNK.Rp for at least tCCDebounce and VBUS is detected. Note the DAM Source may initiate USB PD communications which will cause brief periods of the SNK.Open state on one of the CC pins with the state of the other CC pin remaining SNK.Rp, but this event will not exceed tPDDebounce.		N/A
	A Charge-Through VCONN-Powered USB Device shall transition to Attached.SNK after the state of the Host-side port's CC pin is SNK.Rp for at least tCCDebounce and either host-side VCONN or VBUS is detected.		N/A
	A DRP that strongly prefers the Source role may optionally transition to Try.SRC instead of Attached.SNK when the state of only one CC pin has been SNK.Rp for at least tCCDebounce and VBUS is detected.		N/A
4.5.2.2.5	Attached.SNK State		P
	When in the Attached.SNK state, the port is attached and operating as a Sink. When the		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	port initially enters this state it is also operating as a UFP. The power and data roles can be changed using USB PD commands.		
	A port that entered this state directly from Unattached.SNK due to detecting VBUS shall not determine orientation or availability of higher than Default USB Power and shall not use USB PD.		N/A
4.5.2.2.5.1	Attached.SNK Requirements		P
	If the port needs to determine the orientation of the connector, it shall do so only upon entry to this state by detecting which of the CC1 or CC2 pins is connected through the cable (i.e., the CC pin that is in the SNK.Rp state).		N/A
	If the port supports signaling on SuperSpeed USB pairs, it shall functionally connect the SuperSpeed USB pairs and maintain the connection during and after a USB PD PR_Swap.		P
	If the port has entered the Attached.SNK state from the AttachWait.SNK or TryWait.SNK states, only one the CC1 or CC2 pins will be in the SNK.Rp state. The port shall continue to terminate this CC pin to ground through Rd.		P
	If the port has entered the Attached.SNK state from the Attached.SRC state following a USB PD PR_Swap, the port shall terminate the connected CC pin to ground through Rd.		P
	The port shall meet the Sink Power Sub-State requirements specified in Section 4.5.2.2.22.		P
	If the port is a VCONN-Powered USB Device, it shall respond to USB PD cable identity queries on SOP'. It shall not send or respond to messages on SOP. It shall ensure there is sufficient capacitance on CC to meet cReceiver as defined in USB PD.		N/A
	A Charge-Through VCONN-Powered USB Device shall isolate its Host-side port from its Charge-Through port, including CCs and VBUS, present a high-impedance to ground (above zOPEN) on its Charge-Through port's CC1 and CC2 pins and terminate its Host-side port's CC pin to ground through Rd.		N/A
	A Charge-Through VCONN-Powered USB Device shall start a Charge-Through Support Timer when it enters the Attached.SNK state. If a Charge-Through VCONN-Powered USB Device fails to exit the Attached.SNK state before the Charge-Through Support Timer exceeds tAMETimeout, it shall present a USB Billboard Device Class interface indicating that it does not support Charge-Through.		N/A
	A Charge-Through VCONN-Powered USB Device shall reset the Charge-Through Support Timer when it first receives any USB PD		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	Structured VDM Command it supports. If a Charge-Through VCONN-Powered USB Device receives a Structured VDM Command multiple times, it shall only reset the Charge-Through Support Timer once. This ensures a Charge-Through VCONN-Powered USB Device will present a USB Billboard Device Class interface if it fails to exit Attached.SNK while receiving repeated or continuous Structured VDM Commands (e.g., Discover Identity).		
	A Charge-Through VCONN-Powered USB Device shall reset the Charge-Through Support Timer when it receives any Data Message it supports. A Charge-Through VCONN-Powered USB Device shall hold the Charge-Through Support Timer in reset while it is in any USB PD BIST mode.		N/A
	Except for a VCONN-Powered USB Device or Charge-Through VCONN-Powered USB Device, the port may negotiate a USB PD PR_Swap, DR_Swap or VCONN_Swap.		N/A
	If the port supports Charge-Through VCONN-Powered USB Device, and an explicit USB PD contract has failed to be negotiated, the port shall query the identity of the cable via USB PD on SOP'.		N/A
	If the port supports Charge-Through VCONN-Powered USB Device, and an explicit USB PD contract has failed to be negotiated, the port shall query the identity of the cable via USB PD on SOP'.		N/A
	By default, upon entry from AttachWait.SNK or Unattached.SNK, VCONN shall not be supplied in the Attached.SNK state. If Attached.SNK is entered from Attached.SRC as a result of a USB PD PR_Swap, it shall maintain VCONN supply state, whether on or off, and its data role/connections. A USB PD DR_Swap has no effect on which port sources VCONN.		P
	The port may negotiate a USB PD VCONN_Swap. When the port successfully executes USB PD VCONN_Swap operation and was not sourcing VCONN, it shall start sourcing VCONN within tVCONNON. The port shall execute the VCONN_Swap in a make-before-break sequence in order to keep active USB Type-C to USB Type-C cables powered. When the port successfully executes USB PD VCONN_Swap operation and was sourcing VCONN, it shall stop sourcing VCONN within tVCONNOFF.		N/A
4.5.2.2.5.2	Exiting from Attached.SNK State		P
	A port that is not a VCONN-Powered USB Device and is not in the process of a USB PD		P

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	PR_Swap or a USB PD Hard Reset or a USB PD FR_Swap shall transition to Unattached.SNK within tSinkDisconnect when VBUS falls below vSinkDisconnect for VBUS operating at or below 5 V or below vSinkDisconnectPD when negotiated by USB PD to operate above 5 V.		
	A VCONN-Powered USB Device shall return to Unattached.SNK when VBUS has fallen below vSinkDisconnect and VCONN has fallen below vVCONNDisconnect.		N/A
	A port that has entered into USB PD communications with the Source and has seen the CC voltage exceed vRd-USB may monitor the CC pin to detect cable disconnect in addition to monitoring VBUS.		N/A
	A port that is monitoring the CC voltage for disconnect (but is not in the process of a USB PD PR_Swap or USB PD FR_Swap) shall transition to Unattached.SNK within tSinkDisconnect after the CC voltage remains below vRd-USB for tPDDebounce.		N/A
	If supplying VCONN, the port shall cease to supply it within tVCONNOff of exiting Attached.SNK.		P
	A Charge-Through VCONN-Powered USB Device shall transition to CTUnattached.VPD if VCONN is present and the state of its Host-side port's CC pin is SNK.Open for tVPDCTDD.		N/A
	A port that via SOP' has detected an attached Charge-Through VCONN-Powered USB Device shall transition to TryWait.SRC if implemented, or transition to Unattached.SRC or Unattached.Accessory if TryWait.SRC is not supported. This transition may be delayed until the device has sufficient battery charge needed to remain powered until it reaches the CTAttached.SNK state.		N/A
	After receiving a USB PD PS_RDY from the original Source during a USB PD PR_Swap, the port shall transition directly to the Attached.SRC state (i.e., remove Rd from CC, assert Rp on CC and supply VBUS), but shall maintain its VCONN supply state, whether off or on, and its data role/connections.		P
4.5.2.2.6	UnattachedWait.SRC State		N/A
	When in the UnattachedWait.SRC state, the port is discharging the CC pin that was providing VCONN in the previous Attached.SRC state.		N/A

	The Charge-Through VCONN-Powered USB Device shall transition to Unattached.SNK after tVPDDisable.		N/A
4.5.2.2.26	CTUnattached.SNK State		N/A
	When in the CTUnattached.SNK state, the port has detected that it is attached to a Charge-Through VCONN-Powered USB Device and is ready if a Power Source is attached to the Charge-Through VCONN-Powered USB Device.		N/A
	This state may also have been entered through detach of a Charge-Through Power Source.		N/A
4.5.2.2.26.1	CTUnattached.SNK Requirements		N/A
	Upon entry to this state, the port shall remove its Rp termination (if present) and terminate CC to ground through Rd.		N/A
	The port shall continue to supply VCONN.		N/A
	The port shall stop sourcing or sinking VBUS and discharge it.		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	In USB PD Version 2.0, the port shall initiate PD messages.		N/A
	The port may query the state of the attached VCONN-Powered USB Device by sending SOP' messages on USB PD to read the VPD's eMarker.		N/A
4.5.2.2.26.2	Exiting from CTUnattached.SNK		N/A
	The port shall transition to CTAttached.SNK when VBUS is detected. Note that by this point, the VCONN-Powered USB Device has already de-bounced the passed-through CC pin.		N/A
	The port shall transition to Unattached.SNK if the state of the CC pin is SNK. Open for tVPDDetach after VBUS is vSafe0V.		N/A
4.5.2.2.27	CTAttached.SNK State		N/A
	When in the CTAttached.SNK state, the port is connected to a Charge-Through VCONN-Powered USB Device, which in turn is passing through the connection to a Power Source.		N/A
4.5.2.2.27.1	CTAttached.SNK Requirements		N/A
	The port shall continue to terminate CC to ground through Rd. Since there is now a Power Source connected through to VBUS and CC, the port shall operate in one of the Sink Power Sub-States shown in Figure 4-19, and remain within the Sink Power Sub-States, until either VBUS is removed or a USB PD contract is established with the source.		N/A
	The port shall not negotiate a voltage on VBUS higher than the maximum voltage specified in the Charge-Through VCONN-Powered USB Device's Discover Identity Command response.		N/A
	The port shall continue to supply VCONN.		N/A
	The port shall reject a VCONN swap request.		N/A
	The port shall not perform USB BC 1.2 primary detection, as that will interfere with VPD functionality.		N/A
	In USB PD Version 2.0, the port shall not initiate USB PD messages, although it remains a DFP for USB data.		N/A
	The port shall neither initiate nor respond to any SOP' communication.		N/A
	The port shall meet the Sink Power Sub-State requirements specified in Section 4.5.2.2.29.		N/A
	The port shall meet the additional maximum current constraints described in Section 4.6.2.5.		N/A
	The port shall follow the restrictions on USB PD messages described in Section 4.10.2.		N/A
	The port shall alter its advertised capabilities to UFP role/sink only role as described in Section		N/A

4.5.3.2	USB Type-C port to Legacy Port Interoperability Behaviors		N/A
	The following sub-sections describe port-to-port interoperability behaviors for the various combinations of USB Type-C Source, Sink and DRPs and legacy USB ports.		N/A
4.5.3.2.1	Source to Legacy Device Port Behavior		N/A
	Figure 4-32 illustrates the functional model for a Source connected to a legacy device port. This model is based on having an adapter present as a Sink to the Source. This adapter has a USB Type-C plug on one end plugged into the Source and either a USB Standard-B plug, USB Micro-B plug, USB Mini-B plug, or a USB Standard-A receptacle on the other end.		N/A
	The following describes the behavior when a Source is connected to a legacy device adapter that has an Rd to ground so as to mimic the behavior of a Sink.		N/A
	1. Source in the unattached state		N/A
	2. Source transitions from Unattached.SRC to Attached.SRC through AttachWait.SRC		N/A
	Source detects the Sink's pull-down on CC and enters AttachWait.SRC. After tCCDebounce, it enters Attached.SRC.		N/A
	Source turns on VBUS and VCONN		N/A
	3. While the Source is in the attached state:		N/A
	Source monitors CC for detach and when detected, enters Unattached.SRC		N/A
4.5.3.2.2	Legacy Host Port to Sink Behavior		N/A
	Figure 4-33 illustrates the functional model for a legacy host port connected to a Sink. This model is based on having an adapter that presents itself as a Source to the Sink, this adapter is either a USB Standard-A legacy plug or a USB Micro-B legacy receptacle on one end and the USB Type-C plug on the other end plugged into a Sink.		N/A
	The following describes the behavior when a legacy host adapter that has an Rp to VBUS so as to mimic the behavior of a Source that is connected to a Sink. The value of Rp shall indicate an advertisement of Default USB Power (See Table 4-24), even though the cable itself can carry 3 A. This is because the cable has no knowledge of the capabilities of the power source, and any higher current is negotiated via USB BC 1.2.		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	1. Sink in the unattached state		N/A
	2. Sink transitions from Unattached.SNK to Attached.SNK through AttachWait.SNK if needed.		N/A
	While in Unattached.SNK, if device is not USB 2.0 only, supports accessories or requires more than default power, it enters AttachWait.SNK when it detects a pull up on CC and ignores VBUS. Otherwise, it may enter Attached.SNK directly when VBUS is detected.		N/A
	Sink detects VBUS and enters Attached.SNK		N/A
	3. While the Sink is in the attached state:		N/A
	Sink monitors VBUS for detach and when detected, enters Unattached.SNK		N/A
4.5.3.2.3	DRP to Legacy Device Port Behavior		N/A
	Figure 4-34 illustrates the functional model for a DRP connected to a legacy device port. This model is based on having an adapter present as a Sink (Device) to the DRP. This adapter has a USB Type-C plug on one end plugged into a DRP and either a USB Standard-B plug, USB Micro-B plug, USB Mini-B plug, or a USB Standard-A receptacle on the other end.		N/A
	The following describes the behavior when a DRP is connected to a legacy device adapter that has an Rd to ground so as to mimic the behavior of a Sink.		N/A
	1. DRP in the unattached state		N/A
	DRP alternates between Unattached.SRC and Unattached.SNK		N/A
	2. DRP transitions from Unattached.SRC to Attached.SRC		N/A
	DRP in Unattached.SRC detects the adapter's pull-down on CC and enters AttachWait.SRC		N/A
	DRP in AttachWait.SRC times out (tCCDebounce) and transitions to Attached.SRC		N/A
	DRP in Attached.SRC turns on VBUS and VCONN		N/A
	DRP in AttachWait.SRC may support Try.SNK and if so, may transition through Try.SNK and TryWait.SRC prior to entering Attached.SRC		N/A
	3. While the DRP is in the attached state:		N/A
	DRP monitors CC for detach and when detected, enters Unattached.SNK (and resumes toggling between Unattached.SNK and Unattached.SRC)		N/A
4.5.3.2.4	Legacy Host Port to DRP Behavior		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	Figure 4-35 illustrates the functional model for a legacy host port connected to a DRP operating as a Sink. This model is based on having an adapter that presents itself as a Source (Host) to the DRP operating as a Sink, this adapter is either a USB Standard-A legacy plug or a USB Micro-B legacy receptacle on one end and the USB Type-C plug on the other end plugged into a DRP.		N/A
	The following describes the behavior when a legacy host adapter that has an Rp to VBUS so as to mimic the behavior of a Source is connected to a DRP. The value of Rp shall indicate an advertisement of Default USB Power (See Table 4-24), even though the cable itself can carry 3 A. This is because the cable has no knowledge of the capabilities of the power source, and any higher current is negotiated via USB BC 1.2.		N/A
	1. DRP in the unattached state		N/A
	DRP alternates between Unattached.SRC and Unattached.SNK		N/A
	2. DRP transitions from Unattached.SNK to AttachWait.SNK to Attached.SNK		N/A
	DRP in Unattached.SNK detects pull up on CC and enters AttachWait.SNK.		N/A
	DRP in AttachWait.SNK detects VBUS and enters Attached.SNK		N/A
	DRP in AttachWait.SNK may support Try.SRC and if so, may transition through Try.SRC and TryWait.SNK prior to entering Attached.SNK		N/A
	3. While the DRP is in the attached state:		N/A
	DRP monitors VBUS for detach and when detected, enters Unattached.SNK (and resumes toggling between Unattached.SNK and Unattached.SRC)		N/A
4.6	Power		P
	Power delivery over the USB Type-C connector takes advantage of the existing USB methods as defined by: the USB 2.0 and USB 3.2 specifications, the USB BC 1.2 specification and the USB Power Delivery specification. Power for USB4 operation requires a USB PD explicit contract as defined in Section 5.3 and the USB Power Delivery specification. Prior to entering a USB PD explicit contract, a USB4 port operates as a USB 3.2 port regarding power.		N/A
	The USB Type-C Current mechanism allows the Source to offer more current than defined by the USB BC 1.2 specification. A USB power source shall not provide more than 20 V		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	nominal on VBUS. USB PD power sources that deliver power over a USB Type-C connector shall follow the power rules as defined in Section 10 of the USB Power Delivery specification.		
	All USB Type-C-based devices shall support USB Type-C Current and may support other USB-defined methods for power. The following order of precedence of power negotiation shall be followed: USB BC 1.2 supersedes the USB 2.0 and USB 3.2 specifications, USB Type-C Current at 1.5 A and 3.0 A supersedes USB BC 1.2, and USB Power Delivery supersedes USB Type-C Current. Table 4-17 summarizes this order of precedence of power source usage.		P
	For example, once the PD mode (e.g. a power contract has been negotiated) has been entered, the device shall abide by that power contract ignoring any other previously made or offered by the USB Type-C Current, USB BC 1.2 or USB 2.0 and USB 3.2 specifications. When the PD mode is exited, the device shall fallback in order to the USB Type-C Current, USB BC 1.2 or USB 2.0 and USB 3.2 specification power levels.		P
	All USB Type-C ports shall tolerate being connected to USB power source supplying default USB power, e.g. a host being connected to a legacy USB charger that always supplies VBUS.		P
4.6.1	Power Requirements during USB Suspend		P
	USB Type-C implementations with USB Type-C Current, USB PD and VCONN, along with active cables, requires the need to expand the traditional USB suspend definition.		N/A
4.6.1.1	VBUS Requirements during USB Suspend		P
	The USB 2.0 and USB 3.2 specifications define the amount of current a Sink is allowed to consume during suspend.		N/A
	USB suspend power rules shall apply when the USB Type-C Current is at the Default USB Power level or when USB PD is being used and the Suspend bit is set appropriately.		P
	When USB Type-C Current is set at 1.5 A or 3.0 A, the Sink is allowed to continue to draw current from VBUS during USB suspend. During USB suspend, the Sink's requirement to track and meet the USB Type-C Current advertisement remains in force (See Section 4.5.2.3).		N/A
	USB PD provides a method for the Source to communicate to the Sink whether or not the Sink has to follow the USB power rules for suspend.		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
4.6.1.2	VCONN Requirements during USB Suspend		N/A
	If the Source supplies VBUS power during USB suspend, it shall also supply VCONN and meet the requirements defined in Table 4-5.		N/A
	Electronically Marked Cables shall meet the requirements in Table 4-6 during USB suspend.		N/A
	VCONN powered accessories shall meet the requirements defined in Table 4-7 during USB suspend.		N/A
4.6.2	VBUS Power Provided Over a USB Type-C Cable		P
	The minimum requirement for VBUS power supplied over the USB Type-C cable assembly matches the existing requirement for VBUS supplied over existing legacy USB cable assemblies.		N/A
	USB Power Delivery in Standard Power Range (SPR) operation is intended to work over unmodified USB Type-C to USB Type-C cables, therefore any USB Type-C cable assembly that incorporates electrical components or electronics shall ensure that it tolerate, or be protected from, a VBUS voltage of 21 V.		N/A
	USB Power Delivery in Extended Power Range (EPR) operation requires EPR-compatible USB Type-C to USB Type-C cables. Any USB Type-C cable assembly that incorporates electrical components or electronics that may be powered by VBUS shall ensure that it can functionally tolerate, or be protected from, a VBUS voltage of up to 53.65 V (51 V + 5% + 100mV).		N/A
4.6.2.1	USB Type-C Current		P
	Default USB voltage and current are defined by the USB 2.0 and USB 3.2 specifications. All USB Type-C Current advertisements are at the USB VBUS voltage defined by these specifications.		N/A
	The USB Type-C Current feature provides the following extensions:		N/A
	Higher current than defined by the USB 2.0, the USB 3.2 or the BC 1.2 specifications		N/A
	Allows the power source to manage the current it provides		N/A
	The USB Type-C connector uses CC pins for configuration including an ability for a Source to advertise to its port partner (Sink) the amount of current it shall supply:		N/A
	Default is the as-configured for high-power operation current value as defined by the USB Specification (500 mA for USB 2.0 ports; 900		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	mA or 1,500 mA for USB 3.2 ports in single-lane or dual-lane operation, respectively)		
	1.5 A		N/A
	3.0 A		N/A
	When a Source is advertising USB Type-C Default current, the Sink behavior is defined as follows:		N/A
	It connects as a USB 2.0 or USB 3.2 device, after which the Sink shall follow the appropriate USB specification.		N/A
	It enters a USB PD contract, after which the Sink shall follow the USB PD specification to determine the current (e.g., Rp will no longer be Default as it is superseded by the USB PD contract).		N/A
	It detects a USB BC 1.2 charging port, after which the Sink shall follow the USB BC 1.2 specification.		N/A
	It attaches as a USB Type-C Power Sinking Device (PSD), after which the Sink may draw up to 500 mA and shall meet the inrush requirement for USB 2.0.		N/A
	A PSD shall fully support USB Type-C Current operation, should support USB PD and may support USB BC 1.2. A PSD may be a Sink or a DRP operating in Sink mode. A PSD shall not have a USB or USB Type-C Alternate Mode communications function.		N/A
	The relationship of USB Type-C Current and the equivalent USB PD Power (PDP) value is shown in Table 4-18.		N/A
	A Sink that takes advantage of the additional current offered (e.g., 1.5 A or 3.0 A) shall monitor the CC pins and shall adjust its current consumption within tSinkAdj to remain within the value advertised by the Source. While a USB PD contract is in place, a Sink is not required to monitor USB Type-C current advertisements and shall not respond to USB Type-C current advertisements.		P
	The Source shall supply VBUS to the Sink within tVBUSON. VBUS shall be in the specified voltage range at the advertised current.		P
	A Source (port supplying VBUS) shall protect itself from a Sink that draws current in excess of the port's USB Type-C Current advertisement.		N/A
	The Source adjusts Rp (or current source) to advertise which of the three current levels it supports. See Table 4-24 for the termination requirements for the Source to advertise currents.		N/A
	The value of Rp establishes a voltage (vRd) on CC that is used by the Sink to determine the		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	maximum current it may draw.		
	Table 4-35 defines the CC voltage range observed by the Sink that only support default USB current.		N/A
	If the Sink wants to consume more than the default USB current, it shall track vRd to determine the maximum current it may draw. See Table 4-36.		P
	Figure 4-36 and Figure 4-37 illustrate where the Sink monitors CC for vRd to detect if the host advertises more than the default USB current.		N/A
4.6.2.2	USB Battery Charging 1.2		P
	USB Battery Charging Specification, Revision 1.2 defines a method that uses the USB 2.0 D+ and D- pins to advertise VBUS can supply up to 1.5 A. Support for USB BC 1.2 charging is optional.		N/A
	A USB Type-C port that implements USB BC 1.2 that is capable of supplying at least 1.5 A shall advertise USB Type-C Current at the 1.5 A level within tVBUSON of entering the Attached.SRC state, otherwise the port shall advertise USB Type-C Current at the Default USB Power level. A USB Type-C port that implements USB BC 1.2 that also supports USB Type-C Current at 3.0 A may advertise USB Type-C Current at 3.0 A.		P
	If a Sink that supports USB BC 1.2 detection, detects Rp at the Default USB Power level and does not discover a USB BC 1.2-compliant Source, then it shall limit its maximum current consumption to the standard USB levels based on Table 4-17. This will ensure maximum current limits are not exceeded when connected to a Source which does not support USB BC 1.2.		N/A
	A Sink that supports USB BC 1.2 detection and has a maximum current draw greater than Default USB Type-C Current shall monitor vRd on the CC pins to detect the Source's Rp and shall implement Sink Power Sub-State transitions (Figure 4-19). If a Sink that supports USB BC 1.2 detection and has a maximum current draw greater than Default USB Type-C Current detects Rp at USB Type-C Current of 1.5 A or 3.0 A levels but does not detect a USB BC 1.2 source, it shall limit its maximum current consumption to the appropriate USB Type-C Current level advertised, and shall adjust its current consumption to remain within the value advertised by the Source on Sub-State transitions. For Sub-State transitions starting from a higher power level and ending at a lower power level, the Sink shall reduce power consumption within tSinkAdj. See Sections		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	4.5.2.3.2.2 and 4.5.2.3.3.2.		
	While in a Power Delivery Mode, a device acting as a Sink shall not initiate a USB BC 1.2 detection until the port pair is detached or there is an Error Recovery or Hard Reset.		N/A
4.6.2.3	Proprietary Power Source		P
	This section has been deprecated. Devices with USB Type-C connectors shall only employ signaling methods defined in USB specifications to negotiate power.		P
4.6.2.4	USB Power Delivery		P
	USB Power Delivery is a feature on the USB Type-C connector. When USB PD is implemented, USB PD Bi-phase Mark Coded (BMC) carried on the CC wire shall be used for USB PD communications between USB Type-C ports.		N/A
	At attach, VBUS shall be operationally stable prior to initiating USB PD communications.		N/A
	When not in an Explicit Contract, USB PD Sources that are, based on their PDP, capable of supplying:		N/A
	5 V at 3 A or greater shall advertise USB Type-C Current at the 3 A level		N/A
	5 V at 1.5A or greater but less than 3 A shall advertise USB Type-C Current at the 1.5 A level		N/A
	5 V at less than 1.5A shall advertise USB Type-C Current at the Default USB Power level		N/A
	within tVBUSON of entering the Attached.SRC state. For Multi-Port Shared Capacity Chargers, a USB PD Source capable of supplying 5 V at 3A or greater may initially offer USB Type-C Current at the 1.5 A level and subsequently increase the offer after attach (see Section 4.8.6.2). During USB Suspend a USB PD Source may set its Rp value to default to indicate that the Sink shall only draw USB suspend current as defined in Section 4.6.1.1.		N/A
	While a USB PD Explicit Contract is in place, a Source compliant with USB PD Revision 2 shall advertise a USB Type-C Current of either 1.5 A or 3.0 A. The USB PD Revision 2 Source upon entry into an Explicit Contract shall advertise an Rp value of 1.5 A or 3.0 A after it receives the GoodCRC in response to the first PS_RDY Message.		P
	While a USB PD Explicit Contract is in place, a Source compliant with USB PD Revision 3 shall set the Rp value according to the collision avoidance scheme defined in Section 5.7 of the USB PD Revision 3 specification. The USB PD Revision 3 Source upon entry into an Explicit Contract shall advertise an Rp value consistent with the USB PD Revision 3 collision avoidance		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	scheme.		
	Refer to Section 1.6 of the USB Power Delivery specification for a definition of an Explicit Contract.		N/A
4.6.2.5	Charge-Through VCONN-Powered USB Device (CTVPD) Current Limitations		N/A
	Since Charge-Through VCONN-Powered USB Devices implement charging by passively connecting the Source's CC and VBUS to the Host, the VCONN-Powered USB Device is effectively increasing the impedance on VBUS, GND, and CC between the Power Source and the Host, resulting in impedances that can exceed the maximum allowed for cables. To avoid communication issues and false disconnects from the increased GND and VBUS drops, the following shall occur:		N/A
	1. The Charge-Through VCONN-Powered USB Device shall report its worst-case GND and VBUS impedance (including the extra mated connector pair and FETs) in its USB PD Discover Identity Command response on SOP'.		N/A
	2. The Host that supports Charge-Through VCONN-Powered USB Device shall use this information, along with inferred information about the cable, to limit its maximum current in the case where the Power Source advertises a current greater than what the Charge-Through VCONN-Powered USB Device would allow.		N/A
	The Host has no way to query the cable, as its VCONN source is consumed by the VCONNPowered USB Device. Instead, the Host may assume the cable is 5 A for the purposes of calculating the Charge-Through current limit only if it receives a USB PD SourceCapability PDO of greater than 3 A (even if the Host ultimately does not Request that PDO, or if the host requests a current of 3 A or less).		N/A
	The Host shall further limit its maximum current beyond that advertised by the Power Source, based on the reported GND impedance and the inferred cable capability. GND impedance is reported in the VPD Discover Identity Command Response in 1-milliohm steps and is used in the following formulas:		N/A
	GND-limited current with a 3A cable inferred = $0.25 \text{ V} / (0.25 \text{ V} / 3 \text{ A} + \text{VPD_GND_DCR})$		N/A
	GND-limited current with a 5A cable inferred = $0.25 \text{ V} / (0.25 \text{ V} / 5 \text{ A} + \text{VPD_GND_DCR})$		N/A
	In addition, the increased VBUS impedance could result in a greater than 1 V VBUS drop as measured at the input to the Host. Based on the VBUS impedance reported in the VPD Discover Identity Command Response in 2-		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	milliohm steps and the inferred cable capability, the Host shall either lower its VBUS detach threshold or further limit its maximum current based on the following formulas:		
	VBUS and GND-limited current with a 3A cable inferred = $0.75 \text{ V} / (0.75 \text{ V} / 3 \text{ A} + \text{VPD_VBUS_DCR} + \text{VPD_GND_DCR})$		N/A
	VBUS and GND-limited current with a 5A cable inferred = $0.75 \text{ V} / (0.75 \text{ V} / 5 \text{ A} + \text{VPD_VBUS_DCR} + \text{VPD_GND_DCR})$		N/A
4.6.2.6	USB Type-C Sink Requirements for High Voltage Operation		N/A
	This section sets electrical requirements for USB Type-C Sinks that support high-voltage operation. See Section 3.11 for EPR requirements for USB Type-C cables that support EPR.		N/A
	The Sink shall keep the voltage on its VBUS contact to within 12 volts of the voltage on the Source VBUS contact at the time of the cable plug withdrawal for a minimum of 250 μs from the time the VBUS contacts separate (see Figure 3-1). Refer to Appendix H for more information related to high-voltage contact arcing and mitigation guidelines.		N/A
4.7	USB Hubs		P
	USB 2.0, USB 3.2, and USB4 hubs are defined by the USB 2.0, USB 3.2, and USB4 specifications, respectively. USB hubs implemented with one or more USB Type-C connectors shall comply with these specifications as relevant to a USB Type-C implementation. All the downstream facing USB Type-C ports on a USB hub should support the same functionality or shall be clearly marked as to the functionality supported.		N/A
	USB hubs shall have an upstream facing port (to connect to a host or hub higher in the USB tree) that may be a Sourcing Device (See Section 4.8.4). The hub shall clearly identify to the user its upstream facing port. This may be accomplished by physical isolation, labeling or a combination of both.		N/A
	USB hub's downstream facing ports shall not have Dual-Role-Data (DRD) capabilities. However, these ports may have Dual-Role-Power (DRP) capabilities.		N/A
	CC pins are used for port-to-port connections and shall be supported on all USB Type-C connections on the hub.		N/A
	For USB 2.0 and USB 3.2 hubs, downstream-facing ports shall not implement or pass-through Alternate or Accessory Modes and SBU pins shall not be connected (zSBU Termination) on any USB hub port. For		N/A

Clause	Requirement + Test	Result - Remark	Verdict
	USB4 hubs, see Section 5.2.3.2 regarding support for Alternate Modes.		
	The USB hub's DFPs shall support power source requirements for a Source. See Section 4.8.1.		P
	Additional requirements for USB4 hubs are in Chapter 5.		N/A
4.8	Power Sourcing and Charging		P
	This section defines requirements and recommendations related to using USB Type-C ports for delivering power. Any USB Type-C port that offers more than Default Current and/or supports USB Power Delivery shall meet the requirements as if it is a charger.		N/A
	The following lists the most applicable subsections by USB Type-C ports on:		N/A
	Host systems: 4.8.1 and 4.8.5. Note: 4.8.6 is not intended for host systems.		N/A
	Devices that can supply power: 4.8.4.		N/A
	Hubs:		N/A
	Traditional hubs – Refer to USB 2.0/USB 3.2 base specifications and 4.8.1 as applicable if USB BC 1.2 is supported.		N/A
	Hubs that can supply power beyond the base specs – 4.8.1, 4.8.4, 4.8.5 and 4.8.6.		N/A
	Dedicated chargers:		N/A
	Single-port chargers – 4.8.1.		N/A
	Multi-port chargers – 4.8.1 and 4.8.6.		N/A
4.8.1	DFP as a Power Source		P
	Sources (e.g. battery chargers, hub downstream ports and hosts) may all be used for battery charging. When a charger is implemented with a USB Type-C receptacle or a USB Type-C captive cable, it shall follow all the applicable requirements.		P
	A Source shall expose its power capabilities using the USB Type-C Current method and it may additionally support other USB-standard methods (USB BC 1.2 or USBPD).		P
	A Source advertising its current capability using USB BC 1.2 shall meet the requirements in Section 4.6.2.2 regarding USB Type-C Current advertisement.		P
	A Source that has negotiated a USB-PD contract shall meet the requirements in Section 4.6.2.4 regarding USB Type-C Current advertisement.		P
	If a Source is capable of supplying a voltage greater than default VBUS, it shall fully conform to the USB-PD specification and shall negotiate		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	its power contracts using only USB-PD.		
	If a Source is capable of reversing source and sink power roles, it shall fully conform to the USB-PD specification and shall negotiate its power contracts using only USBPD.		N/A
	If a Source is capable of supplying a current greater than 3.0 A, it shall use the USBPD Discover Identity to determine the current carrying capacity of the cable.		N/A
4.8.1.1	USB-based Chargers with USB Type-C Receptacles		P
	A USB-based charger with a USB Type-C receptacle (Source) shall only apply power to VBUS when it detects a Sink is attached and shall remove power from VBUS when it detects the Sink is detached (vOPEN).		P
	A USB-based charger with a USB Type-C receptacle shall not advertise current exceeding 3.0 A except when it uses the USB-PD Discover Identity mechanism to determine the cable's actual current carrying capability and then it shall limit the advertised current accordingly.		N/A
	A USB-based charger with a USB Type-C receptacle (Source) which is not capable of data communication shall advertise USB Type-C Current of at least 1.5 A within tVBUSON of entering the Attached.SRC state and shall short D+ and D- together with a resistance less than 200 ohms. This will ensure backwards compatibility with legacy sinks which may use USB BC 1.2 for charger detection.		N/A
4.8.1.2	USB-based Chargers with USB Type-C Captive Cables		P
	A USB-based charger with a USB Type-C captive cable that supports USB PD shall only apply power to VBUS when it detects a Sink is attached and shall remove power from VBUS when it detects the Sink is detached (vOPEN).		P
	A USB-based charger with a USB Type-C captive cable that does not support USB PD may supply VBUS at any time. It is recommended that such a charger only apply power to VBUS when it detects a Sink is present and remove power from VBUS when it detects the Sink is not present (vOPEN).		N/A
	A USB-based charger with a USB Type-C captive cable shall limit its current advertisement so as not to exceed the current capability of the cable (up to 5 A).		N/A
	A USB-based charger with a USB Type-C captive cable which is not capable of data communication shall advertise USB Type-C Current of at least 1.5 A. It shall short D+ and D- together with a resistance less than 200		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	ohms. This will ensure backwards compatibility with legacy sinks which may use USB BC 1.2 for charging detection.		
	The voltage as measured at the plug of a USB-based charger with a USB Type-C captive cable may be up to $0.75 \times I / 3 \text{ V}$ ($0 < I \leq 3 \text{ A}$), or $0.75 \times I / 5 \text{ V}$ ($0 < I \leq 5 \text{ A}$) lower than the standard tolerance range for the chosen voltage, where I is the actual current being drawn.		N/A
	A USB-based charger that advertises USB Type-C Current shall output a voltage in the range of $4.75 \text{ V} - 5.5 \text{ V}$ when no current is being drawn and between $4.0 \text{ V} - 5.5 \text{ V}$ at 3 A . The output voltage as a function of load up to the advertised USB Type-C Current (default, 1.5 A and 3 A) shall remain within the cross-hatched area shown in Figure 4-40.		N/A
	A USB PD-based charger that has negotiated a voltage V at $\leq 3 \text{ A}$ shall output a voltage in the range of $V_{\text{max}} (V + 5\%)$ and $V_{\text{min}} (V - 5\%)$ when no current is being drawn and V_{max} and $V_{\text{min}} - 0.75 \text{ V}$ at 3 A . Under all loads, the output voltage shall remain within the cross-hatched area shown in Figure 4-41.		N/A
	A USB PD-based charger that has negotiated a voltage V at between 3 A and 5 A shall output a voltage in the range of $V_{\text{max}} (V + 5\%)$ and $V_{\text{min}} (V - 5\%)$ when no current is being drawn and V_{max} and $V_{\text{min}} - 0.75 \text{ V}$ at 5 A . Under all loads, the output voltage shall remain within the cross hatched area shown in Figure 4-42.		N/A
4.8.2	Non-USB Charging Methods		P
	A product (Source and/or Sink) with a USB Type-C connector shall only employ signalling methods defined in USB specifications to negotiate power over its USB Type-C connector(s).		P
4.8.3	Sinking Host		P
	A Sinking Host is a special sub-class of a DRP that is capable of consuming power but is not capable of acting as a USB device. For example a hub's DFP or a notebook's DFP that operates as a host but not as a device.		N/A
	The Sinking Host shall follow the rules for a DRP (See Section 4.5.1.4 and Figure 4-15). The Sinking DFP shall support USB PD and shall support the DR_Swap command in order to get the Sink into the DFP data role.		P
4.8.4	Sourcing Device		P
	A Sourcing Device is a special sub-class of a DRP that is capable of supplying power but is not capable of acting as a USB host. For example a hub's UFP or a monitor's UFP that		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	operates as a device but not as a host.		
	The Sourcing Device shall follow the rules for a DRP (See Section 4.5.1.4 and Figure 4-15). It shall also follow the requirements for the Source as Power Source (See Section 4.8.1). The Sourcing Device shall support USB PD and shall support the DR_Swap command in order to enable the Source to assume the UFP data role.		P
4.8.5	Charging a System with a Dead Battery		P
	A system that supports being charged by USB whose battery is dead shall apply R_d to both CC1 and CC2 and follow all Sink rules. When it is connected to a Source, DRP or Sourcing Device, the system will receive the default VBUS. It may use any allowed method to increase the amount of power it can use to charge its battery.		P
	Circuitry to present R_d in a dead battery case only needs to guarantee the voltage on CC is pulled within the same range as the voltage clamp implementation of R_d in order for a Source to recognize the Sink and provide VBUS. For example, a 20% resistor of value R_d in series with a FET with $V_{GTH(max)} < V_{CLAMP(max)}$ with the gate weakly pulled to CC would guarantee detection and be removable upon power up.		N/A
	When the system with a dead battery has sufficient charge, it may use the USB PD DR_Swap message to become the DFP.		N/A
4.8.6	USB Type-C Multi-Port Chargers		N/A
	A USB Type-C Multi-Port Charger is a product that exposes multiple USB Type-C Source ports for the purpose of charging multiple connected devices. A compliant USB Type-C charger may offer on each of its ports a mix of power options as defined in Section 4.6.		N/A
	Multi-Port Chargers will generally fall into two categories as defined by the following.		N/A
	1. Assured Capacity Chargers: a multi-port charger where the sum of the maximum capabilities of all of the exposed ports, as indicated to the user, is equal to the total power delivery capacity of the charger.		N/A
	2. Shared Capacity Chargers: a multi-port charger where the sum of the maximum capabilities of all of the exposed ports, as indicated to the user, is less than the total power delivery capacity of the charger.		N/A
	A Multi-Port Charger may offer in a single product separate visually identifiable groupings of charging ports. In this case, each group can independently offer either one of the two		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	charging categories, either an Assured Capacity Charger or a Shared Capacity Charger.		
	This section defines the requirements and provides guidelines for the operation and behaviour of a USB Type-C Multi-Port Charger.		N/A
4.8.6.1	General Requirements		N/A
	Individual source ports shall always comply with power negotiation and rules set forth by the USB Type-C and USB Power Delivery specifications, adjusted as needed when available resources change as other ports take more or less power.		N/A
	The minimum capability of all individual USB Type-C ports of a USB Type-C Multi-Port Charger shall be 5V @ 1.5 A independent of how many of the other ports are in use.		N/A
	When a USB Type-C Charger includes charging ports that are based on USB Standard-A receptacles, the following requirements shall be met.		N/A
	The USB Standard-A ports shall be implemented as an independent group, i.e. USB Standard-A ports shall not be included in a group of USB Type-C ports behaving as a Shared Capacity Charger. Any load change on a USB Type-A port shall not result in a voltage change on any of the USB Type-C ports and vice-versa.		N/A
	The minimum capability of each USB Standard-A port shall be 5V @ 500 mA independent of how many of the other ports are in use.		N/A
4.8.6.2	Multi-Port Charger Behaviors		N/A
	Each Source port of Assured Capacity Chargers shall, by design, behave independently and be unaffected by the status and loading of the other ports. An exception to this behavior is allowed if the charger has to take any action necessary to meet an overall product operational safety requirement due to unexpected behavior on any port.		N/A
	For Shared Capacity Chargers, the following behavioral rules shall apply:		N/A
	Each of the exposed Source Ports shall have the same power capabilities. Each port of the charger shall be capable of the same maximum capability, minimum capability, and be able to draw from the shared power equally.		N/A
	All exposed USB PD unattached Source Ports shall have the same power capabilities.		N/A
	Ports shall have the ability to supply the available shared capacity power up to the port's maximum power.		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	A shared capacity charger's ports may offer less than this value but shall increase the offer up to the required value when the Sink sets the Capabilities Mismatch bit in its response. This may be done in multiple steps, but all ports in the Shared Capacity Group shall reach the maximum power within three seconds.		N/A
	Whenever a power contract is made or changed on any port, the available shared capacity shall be re-computed, and the source shall send updated Source Capability messages as needed.		N/A
	As ports of a Shared Capacity Group are connected, each remaining unattached Source Port shall be capable of advertising the lower of the Maximum Capability of the port OR the Total Shared Capacity – the contracted power for the attached ports – (the number of unattached ports – 1) * the minimum port power.		N/A
	Ports shall offer at least 7.5 W.		N/A
	When calculating the available shared capacity for ports in a Fixed Supply power contract, the shared capacity charger shall use the Voltage times the Maximum Current in the PDO as the power the port is supplying regardless of the actual Operating Current requested in the RDO request.		N/A
	When calculating the available shared capacity for ports in a Fixed Supply power contract, the shared capacity charger shall use the Voltage times the Maximum Current in the PDO as the power the port is supplying regardless of the actual Operating Current requested in the RDO request.		N/A
	Ports when not in a PD contract shall follow the rules for a shared USB Type-C Current source unless there is sufficient remaining power for each port to advertise 15 W.		N/A
	All exposed USB Type-C Current ports shall have the ability to offer the same power capabilities.		N/A
	All ports shall initially offer at least 1.5 A.		N/A
	The total of offers across all the ports shall never exceed the capacity of the shared supply.		N/A
	Ports that initially offer 1.5 A shall increase to 3 A after attach if they have sufficient available shared capacity within one second.		N/A
	Ports shall never offer less than 1.5 A – e.g. shall not offer Default.		N/A
	As Source ports are connected and begin providing power, the remaining Source ports will each have the same power capabilities. The maximum capability may be less than the		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	previously connected ports due to less unused capacity of the total power delivery capacity of the charger. For example, if the total power delivery capacity of a USB Type-C two-port charger is 60 W with a port PDP of 35 W and the first connected Source port has established a 35 W power contract with its connected Sink, then the second Source port will only be able to offer a PDP of 25 W.		
	Each port should start by offering the minimum capability for the port and increase the offering to the Sink upon a connection. For example, if the maximum capability of a USB Type-C only Source port is 3 A, then all of the exposed Source ports will be able to offer 3A. Each port should start by offering less than the max (such as 1.5 A) and then increase the offering to 3 A after an attach. This would happen for each port as it is connected until the unused shared capacity is exhausted, at which point no other ports would increase to 3 A offering. A sink, in this example, would see a starting advertisement of USB Type-C Current @ 1.5 A at attach and would then see the USB Type-C Current advertisement increase to 3 A. As another example, if the maximum capability of a USB Type-C Source port is to offer USB PD with a PDP of 35 W, then all of the exposed Source ports would also support USB PD 35 W. Each port would start by offering something less on initial connection, like 15 W, and then increase the offering with new Source Capabilities when it determines the Sink would like more power. If the Sink is not offered the power it requires, it will send a request with the Capability Mismatch bit set to indicate to the source it wants more power. This will happen for each port as it is connected until the unused shared capacity is exhausted, at which point no other ports would increase the power offering.		N/A
	When establishing the remaining available capacity, a charger that supports policy-based power rebalancing may include the power that can be reclaimed from ports already in use:		N/A
	1. by adjusting advertised source capabilities equivalent with a reduced PDP to one or more ports that are already in use; or		N/A
	2. by issuing a USB PD GotoMin command to one or more ports already in use.		N/A
	Policy-based power rebalancing should consider providing good user experience and preserving nominal USB functionality on impacted devices. Fixed rebalancing algorithms that do not factor in overall USB system policy may not be appropriate for power rebalancing		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	implementations.		
4.8.6.3	Multi-Port Charger Port Labeling		N/A
	Multi-port chargers shall have OEM-designed port labeling consistent with the following rules.		N/A
	For Assured Capacity Chargers, each exposed Source port shall be labeled to indicate the PDP of the port. In this case, the user will be able to expect that each of the labeled ports will be able to meet power contracts consistent with the labelling independent of how many of the Source ports are in use.		N/A
	For Shared Capacity Chargers, each Source port shall be labeled to indicate the same PDP. Additionally, the charger shall have a label that, with a minimum of equal visual prominence, indicates the total power delivery capacity being shared across all of the ports identified as a group.		N/A
	A Multi-Port Charger that offers in a single product separate groupings of charging ports, each grouping shall be clearly identified as a separate grouping and each grouping shall be individually labeled consistent with that group's behavior model, either as an Assured Capacity Charger or a Shared Capacity Charger.		N/A
	Refer to the USB Implementers Forum (USB-IF) for USB Type-C Chargers certification along with further labeling guidelines.		N/A
4.8.6.4	Multi-Port Charger that include USB Data Hub Functionality		N/A
	Multi-Port chargers that also incorporate USB data hub capabilities shall meet the same requirements as standalone chargers. These charging-capable hubs shall be self-powered and shall fully operate as a charger independent of the state of the USB data bus connections.		N/A
	For hub-based Multi-Port Chargers that offer power to the upstream-facing port (to the host), this port may either behave as an Assured Capacity Charging port (e.g. be a dedicated charging port) or as a Shared Capacity Charging port (e.g. sharing capacity with downstream-facing ports). In either case, it should be clearly labeled consistent with its designed behavior, including identifying it as part of a group if it is sharing capacity with other ports.		N/A
	When the upstream-facing port is sharing capacity with the downstream-facing ports, the PDP of the upstream-facing port can differ from the downstream-facing ports.		N/A
4.9	Electronically Marked Cables		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	All USB Full-Featured Type-C cables shall be electronically marked. USB 2.0 Type-C cables may be electronically marked. An eMarker is element in an Electronically Marked Cable that returns information about the cable in response to a USB PD Discover Identity command.		N/A
	Electronically marked cables shall support USB Power Delivery Structured VDM Discover Identity command directed to SOP' (the eMarker). This provides a method to determine the characteristics of the cable, e.g. its current carrying capability, its performance, vendor identification, etc. This may be referred to as the USB Type-C Cable ID function.		N/A
	Prior to an explicit USB PD contract, a Sourcing Device is allowed to use SOP' to discover the cable's identity. After an explicit USB PD contract has been negotiated, only the Source shall communicate with SOP' and SOP" (see Section 6.2.1).		N/A
	Passive cables that include an eMarker shall follow the Cable State Machine defined in Section 4.5.2.4 and Figure 4-20.		N/A
	Once VCONN is available, all electronically marked cables shall use it as the only power source. If VCONN is applied after VBUS then until VCONN is available, the cable may remain unpowered or may draw power from VBUS. Within tVCONNswitch, the cable shall switch from VBUS to VCONN. Cables that include an eMarker shall meet the maximum power defined in Table 4-6. The only exception is an Optically Isolated Active Cable (OIAC Section 6), which can draw from both VCONN and VBUS.		N/A
	Refer to Table 4-5 for the requirements of a Source to supply VCONN. When VCONN is not present, a powered cable shall not interfere with normal CC operation including Sink detection, current advertisement and USB PD operation.		N/A
	Figure 4-43 illustrates a typical electronically marked cable. The isolation elements (Iso) shall prevent VCONN from traversing end-to-end through the cable. Ra is required in the cable to allow the Source to determine that VCONN is needed.		N/A
	Figure 4-44 illustrates an electronically marked cable where the VCONN wire does not extend through the cable, therefore an SOP' (eMarker) element is required at each end of the cable. In this case, no isolation elements are needed.		N/A
	For cables that only respond to SOP', the location of the responder is not relevant.		N/A
4.9.1	Parameter Values		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
4.9.2	Active Cables		N/A
	An active cable is an electronically marked cable that incorporates data bus signal conditioning circuits, for example to allow for implementing longer cables. Active cables with data bus signal conditioning in both plugs shall implement SOP' and may implement SOP". Active cables shall meet the power requirements defined in Table 4-6.		N/A
	Active cables may support either one TX/RX pair or two TX/RX pairs. The eMarker in the cable shall identify the number of TX/RX lanes supported. Active cables may or may not require configuration management. Active cable configuration management is defined in Section 5.5.4.		N/A
4.10	VCONN-Powered Accessories (VPAs) and VCONN-Powered USB Devices (VPDs)		N/A
	VCONN-Powered Accessories and VCONN-Powered USB Devices are both direct-attach Sinks that can operate with just VCONN.		N/A
	Both expose a maximum impedance to ground of Ra on the VCONN pin and Rd on the CC pin.		N/A
	The removal of VCONN when VBUS is not present shall be treated as a detach event.		N/A
4.10.1	VCONN-Powered Accessories (VPAs)		N/A
	A VCONN-Powered Accessory implements an Alternate Mode (See Appendix E).		N/A
	VCONN-Powered Accessories shall comply with Table 4-7.		N/A
	When operating in the Sink role and when VBUS is not present, VCONN-Powered Accessories shall treat the application of VCONN as an attach signal, and shall respond to USB Power Delivery messages.		N/A
	When powered by only VCONN, a VCONN-Powered Accessory shall negotiate an Alternate Mode. If it fails to negotiate an Alternate Mode within tAMETimeout, its port partner removes VCONN.		N/A
	When VBUS is supplied, a VCONN-Powered Accessory is subject to all of the requirements for Alternate Modes, including presenting a USB Billboard Device Class interface if negotiation for an Alternate Mode fails.		N/A
	Should a VCONN-Powered Accessory wish to provide charge-through functionality, it must do so by negotiating voltage and current independently on both the Host and charge-through ports, and possibly re-regulating the voltage from the Source before passing it through to the Sink. The Sink is able to take the		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	full current that is advertised to it by the VCONN-Powered Accessory.		
4.10.2	VCONN-Powered USB Devices (VPDs)		N/A
	A VCONN-Powered USB Device shall implement a USB UFP endpoint.		N/A
	VCONN-Powered USB Devices shall comply with Table 4-8.		N/A
	When VBUS is not present, VCONN-Powered USB Devices shall treat the application of VCONN as an attach signal.		N/A
	A VCONN-Powered USB Device shall respond to USB PD messaging on SOP' and shall not respond to other USB PD messaging. A VCONN-Powered USB Device shall respond to USB PD Hard Reset and Cable Reset signaling.		N/A
	A Charge-Through VCONN -Powered USB Device shall discard all USB PD messages while a connection is enabled between the host port CC and Charge-Through port CC.		N/A
	When VBUS is supplied by the Host, the VCONN-Powered USB Device shall behave like a normal UFP Sink, but still only respond to USB PD messaging on SOP'. If VBUS is subsequently removed while VCONN remains applied, the VCONN-Powered USB Device shall remain connected, and use VCONN as the sole detach signal.		N/A
	Since VCONN-Powered USB Devices do not respond to USB PD on SOP, they cannot enter Alternate Modes.		N/A
	A VCONN-Powered USB Device may provide Charge-Through functionality via VPD Charge-Through. VCONN-Powered USB Devices shall not provide any data pass-through to the Charge-Through port other than the CC wire.		N/A
	Since the power and CC negotiation is passed through directly, the Sink shall limit its maximum current based on the additional impedance introduced by the VCONN-Powered USB Device.		N/A
	Additionally, since power can only flow from the Charge-Through port to the Host, VCONN must be provided by the host, and there is no data connection beyond the CC wire passed through to the connected source, there are limitations on what the Host can advertise and support via USB PD:		N/A
	The Host shall not negotiate or accept a PR_Swap or VCONN_Swap		N/A
	The Host shall not enable FR_Swap		N/A
	The Host may only negotiate a DR_Swap when using USB PD Revision 2.0, and only for the		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	purpose of switching which side initiates PD communications. The Host will always remain a DFP for USB data.		
	The Host shall not advertise dual-role data or dual-role power in its SourceCapability or SinkCapability messages – Host changes its advertised capabilities to UFP role/sink only role.		N/A
	The Host shall not negotiate any Alternate Modes that change the function of pins on the connector.		N/A
	The Host shall represent itself to the Charge-Through Source using USB PD as if it were a Sink-only, data-less device.		N/A
4.11	Parameter Values		N/A
4.11.1	Termination Parameters		N/A
	Table 4-24 provides the values that shall be used for the Source's Rp or current source. Other pull-up voltages shall be allowed if they remain less than 5.5 V and fall within the correct voltage ranges on the Sink side – see Table 4-32, Table 4-33 and Table 4-34. Note: when two Sources are connected together, they may use different termination methods which could result in unexpected current flow.		N/A
	The Sink may find it convenient to implement Rd in multiple ways simultaneously (a wide range Rd when unpowered and a trimmed Rd when powered). Transitions between Rd implementations that do not exceed tCCDebounce shall not be interpreted as exceeding the wider Rd range. Transitions between Rd implementations shall not allow the voltage on CC to go outside the voltage band that defines a connection. Table 4-25 provides the methods and values that shall be used for the Sink's Rd implementation.		N/A
	Table 4-27 provides the minimum impedance value to ground on CC for a device (Sink or Source) to be undetected by a Source. This shall apply for ports in the Disabled state or ErrorRecovery state. This shall also apply for Sources when unpowered (for example a power brick unplugged from AC mains).		N/A
4.11.2	Timing Parameters		N/A
	Table 4-29 provides the timing values that shall be met for delivering power over VBUS and VCONN.		N/A
	Figure 4-46 illustrates the timing parameters associated with the DRP toggling process. The tDRP parameter represents the overall period for a single cycle during which the port is exposed as both a Source and a Sink. The portion of the period where the DRP is exposed		N/A

EN IEC 62680-1-3			
Clause	Requirement + Test	Result - Remark	Verdict
	as a Source is established by dcSRC.DRP and the maximum transition time between the exposed states is dictated by tDRPTransition.		
	Table 4-30 provides the timing values that shall be met for DRPs. The clock used to control DRP swap should not be derived from a precision timing source such as a crystal, ceramic resonator, etc. to help minimize the probability of two DRP devices indefinitely failing to resolve into a Source-to-Sink relationship. Similarly, the percentage of time that a DRP spends advertising Source should not be derived from a precision timing source.		N/A
	Table 4-31 provides the timing requirement for CC connection behaviors.		N/A
4.11.3	Voltage Parameters		N/A
	Table 4-32, Table 4-33 and Table 4-34 provide the CC voltage values that a Source shall use to detect what is attached based on the USB Type-C Current advertisement (Default USB, 1.5A @ 5 V, or 3.0 A @ 5 V) that the Source is offering.		N/A
	Table 4-35 provides the CC voltage values that shall be detected across a Sink's Rd for a Sink that does not support higher than default USB Type-C Current Source advertisements.		N/A
	Table 4-36 provides the CC voltage values that shall be detected across a Sink's Rd for a Sink that implements detection of higher than default USB Type-C Current Source advertisements. This table includes consideration for the effect that the IR drop across the cable GND has on the voltage across the Sink's Rd.		N/A
	Table 4-37 provides the clamping voltage that any port (Source, Sink or DRP) may clamp its CC pin to protect from damage. The inclusion of clamping shall not impact the functionality when the CC pin is functioning as VCONN Source or Sink.		N/A

		Validate attention request message initiated by DUT - COMMON.PROC.PD.9#1	PASS
		Structured VDM message header check - COMMON.PROC.PD.9#2	PASS
		COMMON_PROC_PD_10_UUT_Sent_Request - COMMON.PROC.PD.10	PASS
		Validate request message initiated by DUT - COMMON.PROC.PD.10#1	PASS
		COMMON_PROC_PD_11_UUT_Sent_Source_Capabilities - COMMON.PROC.PD.11	PASS
		Validate Source capabilities message initiated by DUT - COMMON.PROC.PD.11#1	PASS
		DUT should respond with Accept - COMMON.PROC.PD.11#2	PASS
		DUT should send PS_RDY - COMMON.PROC.PD.11#3	PASS
		Wait Message - COMMON.PROC.PD.11#4	PASS
		COMMON_PROC_PD_12_UUT_Sent_DR_Swap - COMMON.PROC.PD.12	PASS
		Validate DR_Swap message initiated by DUT - COMMON.PROC.PD.12#1	PASS
		COMMON_PROC_PD_17_Tester_Sent_Vconn_swap_message - COMMON.PROC.PD.17	PASS
		VCONN present check - COMMON.PROC.PD.17#1	PASS
		PS_RDY is - COMMON.PROC.PD.17#2	PASS
		VCONN present check - COMMON.PROC.PD.17#3	PASS
		tVONNSourceOff timer check - COMMON.PROC.PD.17#4	PASS
		COMMON_PROC_PD_18_Tester_Sent_Request_with_Capability_match - COMMON.PROC.PD.18	PASS
		Check PS_RDY - COMMON.PROC.PD.18#1	PASS
		CCheck Source Capability matches VIF - COMMON.PROC.PD.18#2	PASS
		Check PS_RDY - COMMON.PROC.PD.18#3	PASS
		COMMON_PROC_PD3_1_Sink_Start_an_AMS - COMMON.PROC.PD3.1	PASS
		Sink Start AMS - COMMON.PROC.PD3.1#1	PASS
		COMMON_PROC_PD3_2_UUT_Sent_EPR_Source_Cap_message - COMMON.PROC.PD3.2	PASS
		Validate EPR_Source_Capabilities message initiated by UUT - COMMON.PROC.PD3.2#1	PASS
		UUT should respond with Accept - COMMON.PROC.PD3.2#2	PASS

SI No	Test ID	Test Name	Test Result
		UUT should send PS_RDY - COMMON.PROC.PD3.2#3	PASS
		COMMON_PROC_PD3_3_UUT_Sent_EPR_Get_Source_Cap - COMMON.PROC.PD3.3	PASS
		Validate EPR Get Source Capabilities message initiated by DUT - COMMON.PROC.PD3.3#1	PASS
		DUT's EPR Request message validation - COMMON.PROC.PD3.3#2	PASS
		Requested Voltage and PDP - COMMON.PROC.PD3.3#3	PASS
		COMMON_PROC_PD3_4_UUT_Sent_EPR_Request - COMMON.PROC.PD3.4	PASS
		Validate EPR Request message initiated by DUT - COMMON.PROC.PD3.4#1	PASS
		COMMON_PROC_PD3_5_Tester_Sent_EPR_Mode_Enter - COMMON.PROC.PD3.5	PASS
		Validate EPR Enter Enter initiated by DUT - COMMON.PROC.PD3.5#1	PASS
		VIF Field Has Invariant PDOs check - COMMON.PROC.PD3.5#2	PASS
		UUT Request message check - COMMON.PROC.PD3.5#3	PASS
		UUT sends a wait message - COMMON.PROC.PD3.5#4	PASS
		UUT sends PSRdy Message - COMMON.PROC.PD3.5#5	PASS
		VIF specified Source Capabilities - COMMON.PROC.PD3.5#6	PASS
		Source Cap message - COMMON.PROC.PD3.5#7	PASS
		UUT EPR Mode Enter - COMMON.PROC.PD3.5#8	PASS
		UUT Not Supported Message - COMMON.PROC.PD3.5#9	PASS
		UUT EPR Mode Enter Acknowledged - COMMON.PROC.PD3.5#10	PASS
		UUT VCONN Swap Message - COMMON.PROC.PD3.5#11	PASS
		UUT EPR Source Capabilities Message - COMMON.PROC.PD3.5#12	PASS
		UUT EPR Contract - COMMON.PROC.PD3.5#13	PASS
		COMMON_PROC_PD3_6_UUT_Sent_EPR_Mode_Enter - COMMON.PROC.PD3.6	PASS
		Validate EPR Mode Enter initiated by DUT - COMMON.PROC.PD3.6#1	PASS
		Validate EPR Mode Enter response - COMMON.PROC.PD3.6#2	PASS
		Tester sends a Vconn Swap message - COMMON.PROC.PD3.6#3	PASS
		Validate EPR Mode Enter message - COMMON.PROC.PD3.6#4	PASS

SI No	Test ID	Test Name	Test Result
		Validate SOP' Discover_Id and EPR Mode Enter Succeeded message - COMMON.PROC.PD3.6#5	PASS
		EPR_Source_Cap message - COMMON.PROC.PD3.6#6	PASS
		UUT establishes EPR contract - COMMON.PROC.PD3.6#7	PASS
		COMMON_PROC_PD3_7_Tester_Sends_EPR_KeepAlive_Message - COMMON.PROC.PD3.7	PASS
		Validate EPR_KeepAlive response message initiated by DUT - COMMON.PROC.PD3.7#1	PASS

BMC Eye Diagram

GRL-USB-PD Compliance Test Solution

DUT Information

Manufacturer : Shenzhen Huafurui Technology Co., Ltd.
Model : KINGKONG ACE 5
Serial No. :

Test Information

Test Lab : Shenzhen TCT Testing Technology Co., Ltd.
Test_Engineer : Kevin Li
Remarks : Remarks
Date : 2025_10_17

Environment Information

Parameter	Value
GRL_USB_PD_Controller_Serial_No	GRL-C2-EPR-2022070
GRL_USB_PD_Software_Version	1.6.35.0
GRL_USB_PD_Firmware_Version	1.3.22
GRL USB-PD Ethernet Buffer Size	62K
GRL USB-PD Eload Firmware Version	1.5 / 1.5
GRL USB-PD PPS Firmware Version	4.0 / 4.0
Calibration	Calibration Expired
RX mask Power selection	Neutral Power
Device_Type	DRP

Parameter	Value
Cable Type	GRL_SPL_EPR_CABLE_1
Impedance (milli ohm)	1
FUNCTIONAL_TESTS CTS Version	v0.91
USB_PD_Spec Version	Rev3.2 Ver1.1RC2
USB_Type_C_Spec Version	v2.3 Oct-2023
VIF_File_Name	UNISOC-L6_UNISOC-L6-6_REV-1.0_1.0.xml
Noise Pattern Generation:	Two-Tone Noise
Application mode	Compliance

USB-C Functional Tests Information

Parameter	Value
Enable USB Data validation	Enabled
Is Dead Battery connected to PUT	Enabled
Number of USB Type-C Ports	0
Number of USB Type-B or Micro-B Ports or Type-A plug	0
Connected Hub is Embedded	Disabled

Device Info Capabilities

Parameter	Vendor Info File	Get Capabilities
Port_Label	0	
Connector_Type	Type-C®	
USB4_Supported	NO
